INCOMPLETE: network access in this session was limited to anthropic.com and GitHub (every other host, including stanford.edu, yale.edu, challengergray.com, nber.org, arxiv.org, ons.gov.uk, bankofengland.co.uk, imf.org, oecd.org, newyorkfed.org, was refused by the proxy). A gap-fill pass (Nov 2026, 27 searches) added UK, euro-area, IMF, Goldman, Fed regional, SignalFire, Handshake, ISE, Indeed and Adzuna material from search extracts only. Still missing or thin: any Bank of England Decision Maker Panel AI-specific result (none found); a verified ONS BICS AI-headcount figure (only a secondary 6%); the OECD Employment Outlook 2025 and 2026 AI chapters' actual findings; Goldman Sachs primary notes; Felten AIOE; Acemoglu macro estimate; KPMG UK; the Morgan Stanley primary note. Figures marked "search summary" or "search extract" were not fetched and must be re-verified before citing.

Track 7: Displacement

Last updated: 2026-11-06. Labels: EVIDENCE = measured/primary data; FORECAST = projection; OPINION = argument, vendor or consultancy view.

Verification note (added 2026-11-06): page fetches were blocked for most hosts this session, so findings marked search summary, search extract or snippet rest on search-engine extracts of the cited URL. Quotation marks inside findings mark wording as reported by that source; only quotes in this file's "Verbatim quotes" section (and in 13-quotes.md) were checked against a fetched page. Corrections from the verification pass are in verification.md.

Verification key used in this file. "Fetched" = primary page or PDF read this session. "Search summary" = figure seen only in a web-search result summary because the host was blocked; treat as unverified until someone opens the source.

Summary

- **No aggregate job loss is visible yet in the US data that is good enough to show one.** Anthropic's CPS analysis (March 2026) finds no rise in unemployment among the most AI-exposed workers since late 2022 and could have detected a differential of about 1 percentage point. Yale Budget Lab (Oct 2025, early 2026) and the Danish administrative data (Humlum and Vestergaard) say the same. This is the strongest single finding of the track and it cuts against "AI is already destroying jobs" headlines.
- **The effect that does show up is on entry, not exit.** Every serious US dataset that splits by age or seniority finds the same shape: fewer young or junior people hired into AI-exposed occupations, while incumbents and seniors are untouched or growing. ADP payroll (Stanford, gap for 22 to 25 year olds widened to about 19% by June 2026, search summary), Revelio résumé data (Hosseini and Lichtinger, junior employment at adopting firms down about 9% after six quarters, fetched), CPS job-finding rates (Anthropic, minus 14% for 22 to 25, barely significant, fetched), Swedish register data (Lodefalk et al. 2026, minus 5.5%, cited in a fetched paper).
- **The mechanism is a hiring freeze, not layoffs.** Hosseini and Lichtinger find adopting firms hired about 80% fewer juniors per quarter than before, while junior separations actually fell. They also suggest firms may be cutting hiring in anticipation of automation, and that if firms overestimate what GenAI can do, the drop "may ultimately prove temporary". That matters for the thesis: some of the measured "displacement" may be driven by beliefs about AI rather than by AI working in production.

- **Layoff announcements citing AI are a poor measure.** Challenger counted 112,713 AI-attributed announced US cuts in January to July 2026, more than double the 2025 total (corroborated in the verification pass). A January to October figure of about 121,000 (about 20% of announced cuts, with AI falling behind "market/economic conditions" by October) appeared in one search summary but could NOT be confirmed in the verification pass; see verification.md. Announcements are not realised layoffs, reasons are taken from company statements, and against a BLS JOLTS layoff rate of about 1.1% of employment per month the AI-cited count is a very small share of all involuntary separations.
- **Freelance platforms show the clearest direct substitution.** Writing and coding job posts on a large freelance platform fell about 21% relative to manual work within eight months of ChatGPT (Demirci, Hannane, Zhu, 1.39 million posts). Upwork writers lost about 5% of monthly earnings (Hui, Reshef, Zhou). These are the cleanest causal designs but cover a small, unusually exposed slice of work.
- **UK and euro area look like the US: a junior-postings gradient, no aggregate job loss.** Bank of England staff find UK adverts down 15% in the most AI-exposed occupations vs 6% in the least over three years (Aug 2026, search extract), but Bloomberg Economics and the NY Fed note exposed-role vacancies were falling before ChatGPT, and UK firms blame demand and 2025 employment-cost rises. ECB firm surveys (about 5,000 firms, 2025) find AI-using firms more likely to hire than fire. ONS does not track AI against graduate outcomes, so there is no UK equivalent of the US payroll studies.
- **The UK "8% of jobs lost" figure is not a labour-market statistic.** It comes from a Morgan Stanley survey of firms that had used AI for at least a year, in five sectors, asking about their own headcount changes (search summary). It cannot be read as 8% of UK jobs.
- **Perceptions run well ahead of measurement.** In a nationally representative US survey (n=10,980, Aug 2026), people who expect AI to do 80%+ of their work forecast 12.2% unemployment in 2030. Measured unemployment effects so far are statistically indistinguishable from zero.

Key findings

Aggregate employment and unemployment (US)

- **[EVIDENCE]** No systematic increase in unemployment for highly exposed US workers since late 2022. Method: CPS microdata, difference-in-differences comparing the top quartile of "observed exposure" (tasks LLMs could speed up that actually appear in work-related Claude usage, from O*NET tasks, Eloundou et al. β scores and Anthropic Economic Index data from Aug and Nov 2025) with the roughly 30% of workers with zero exposure; break at ChatGPT's release. The post-ChatGPT change in the gap is "small and insignificant". The design could detect a differential rise of roughly 1 percentage point. Robustness checks use alternative cut-offs and Department of Labor unemployment-insurance claims. Massenkoff and McCrory, Anthropic, 5 Mar 2026 (fetched). https://www.anthropic.com/research/labor-market-impacts
    - Caveat: Anthropic is an interested party (it sells the technology), and the exposure measure is built from its own usage data. The direction of the result (no effect) runs against the commercial story that AI is transformative, which makes it somewhat more credible, not less.
- **[EVIDENCE]** Yale Budget Lab with Brookings (Gimbel, Kinder, Kendall, Lee), Oct 2025: in the 33 months after ChatGPT, no relationship between AI exposure, automation or augmentation measures and changes in US employment or unemployment; the occupational mix changed at an unremarkable pace. Search summary (host blocked); report existence and authors confirmed in the reference list of the fetched Anthropic paper. https://budgetlab.yale.edu ;

coverage https://letsdatascience.com/news/yale-analysis-finds-no-economy-wide-ai-job-disruption-e87edd9f

- **[EVIDENCE]** Yale Budget Lab early-2026 follow-up, "AI Is Probably Not (Yet) the Reason for Labor Market Weakening": CPS microdata comparing exposed and unexposed occupations; results do not yet clearly show AI effects. Search summary only. https://budgetlab.yale.edu/node/1495/pdf
- **[OPINION]** Martha Gimbel (Yale Budget Lab) told Fortune there do not seem to be major macroeconomic effects yet, and linked some AI-attributed layoffs to other pressures (tariffs, immigration), i.e. "AI-washing". Fortune, 2 Feb 2026. Search summary only, paraphrased. https://fortune.com/2026/02/02/ai-labor-market-yale-budget-lab-ai-washing/
- **[EVIDENCE]** Other CPS-based studies are split. Chandar (2025, SSRN 5384519) and a Financial Times analysis (24 Jul 2025) find no systematic employment differences between more and less exposed occupations; Eckhardt and Goldschlag (Economic Innovation Group, 2025) test five exposure measures and find significant unemployment differences for only two, both small; Dominski and Lee (2025, arXiv 2507.08244) find higher exposure associated with lower employment; Crane and Soto (2026) find coder employment growth about 3 percentage points lower post-ChatGPT after controlling for industry shocks. All as summarised in the literature review of Hosseini and Lichtinger, May 2026 version (fetched). https://raw.githubusercontent.com/s-mahdihosseini/Website/b99fa2962dcc4c165bbc3c41dd283afa99c5ccfb/GenAI_SenBTC_May_2026.pdf

Young workers and the hiring pipeline

- **[EVIDENCE]** Brynjolfsson, Chandar, Chen, "Canaries in the Coal Mine? Six Facts about the Recent Employment Effects of AI" (Stanford Digital Economy Lab). ADP payroll microdata (millions of workers at ADP client firms; monthly, from Jan 2021). Headline: workers aged 22 to 25 in the most AI-exposed occupations saw a relative employment decline since late 2022 while older workers in the same occupations kept growing; adjustment is via hiring, not wages or layoffs. The headline number has moved across versions:
  - Aug 2025 first version: about 13% relative decline (as cited in Hosseini and Lichtinger, fetched).
  - Anthropic (Mar 2026, fetched) describes the paper as reporting a 6 to 16% fall, depending on specification.
  - Nov 2025 revision: 16% (search summary). https://digitaleconomy.stanford.edu/app/uploads/2025/11/CanariesintheCoalMine_Nov25.pdf
  - Revised 12 Aug 2026: gap "widened to 19% by June 2026", with the authors still saying they see no widespread, economy-wide displacement and describing the facts as descriptive, not causal. Brynjolfsson says checks for interest rates, remote work and the tech boom-bust do not explain it (search summary). https://digitaleconomy.stanford.edu/news/canariesaug26/
  - Gap-fill corroboration (second search, Nov 2026): a separate search returned the revision PDF itself (https://digitaleconomy.stanford.edu/app/uploads/2026/08/Canaries_August2026.pdf, search extract) plus independent secondary coverage (aiweekly.co). Both give 19% as of June 2026, the mechanism as reduced hiring rather than separations, and no economy-wide displacement. New detail from the extract: the revision puts the gap at 15% for the July 2025 data vintage (not the 13% headline of the first version, so the earlier vintage itself appears to have been re-estimated), and the sample as ADP payroll for about 4.6 million workers in 730+ occupations. The 19% figure is now corroborated by two search results, but still not read in full. EVIDENCE.

    - Stanford/ADP "Canaries Dashboard" launched June 2026, monthly updates; Fortune reported employment in highly exposed occupations shrinking at 3.8% a year for 22 to 25 year olds (search summary). https://digitaleconomy.stanford.edu/project/indicators/canaries-dashboard/ ; https://fortune.com/2026/06/27/what-is-ai-impact-entry-level-jobs-stanford-adp-canaries-brynjolfsson-richardson/
    - Limits: ADP clients are not a random sample of US employers; occupation exposure is assigned, not measured use; descriptive by the authors' own account.

- **[EVIDENCE]** Hosseini and Lichtinger (Harvard), "Generative AI as Seniority-Biased Technological Change", version of 6 May 2026 (fetched). Revelio Labs LinkedIn résumé and posting data: about 66 million workers, 281,000 US firms, 160 million employment spells, almost 200 million postings, 2015 to 2025. Adoption identified by posting a "GenAI integrator" role (LLM-classified): 10,433 adopters, 3.7% of firms but 16% of employment. Results:
    - Junior employment at adopters fell about 9% relative to non-adopters six quarters after 2023Q1; senior employment showed no break. Triple-difference with firm-by-time and industry-by-time-by-seniority fixed effects gives the same answer.
    - Staggered event study: no pre-trends for eight quarters; junior employment down 8% eight quarters after adoption.
    - Junior employment in high-exposure occupations fell about 7% relative to low-exposure occupations between 2022Q4 and 2025Q1.
    - Mechanism: adopters hired 4.0 fewer juniors per quarter, about 80% below the pre-period mean of 5.06; junior separations fell (by 1.1 per quarter); promotions rose slightly.
    - Interest rates: a formal test using high-frequency monetary-policy surprises finds juniors at adopters do not respond differently to rate shocks.
    - U-shaped by university prestige: mid-tier graduates hit hardest.
    - Adopters are concentrated in professional services (28%) and information (24%). The authors report the hiring contraction is broad-based across industries. (Earlier secondary coverage said effects were largest in wholesale and retail; the May 2026 text says broad-based. Cite the current version.)
    - Limits: adoption is proxied by a job posting; adopters are larger, more senior-heavy firms; LinkedIn under-represents some sectors.

- **[EVIDENCE]** Anthropic CPS analysis: job-finding rate for 22 to 25 year olds entering the most exposed occupations fell about 14% relative to 2022, "just barely statistically significant"; no decrease for over-25s; unemployment of young exposed workers is flat. The authors note non-hires may be staying in existing jobs, taking other jobs or returning to school. 5 Mar 2026 (fetched). https://www.anthropic.com/research/labor-market-impacts

- **[EVIDENCE]** Lodefalk, Löthman, Koch, Engberg (2026), Swedish job-posting and register data, employer-level difference-in-differences: since ChatGPT, employment of 22 to 25 year olds in high-exposure occupations fell about 5.5% relative to less-exposed occupations within the same employers; workers over 50 rose slightly. Cited in Hosseini and Lichtinger May 2026 (fetched). This is the main European evidence in this file and it matches the US pattern at a smaller magnitude.
    - Gap-fill: original now located. "Same Storm, Different Boats: Generative AI and the Age Gradient in Hiring", Örebro University / Ratio working paper 2/2026, dated 16 Mar 2026. Whole-workforce Swedish register data plus about 4.6 million ads from Sweden's largest recruitment platform. Adds two points: the broad fall in Swedish postings since 2022

lines up with monetary tightening, not AI; the junior decline (5.5% by early 2025) runs through slower hiring, not separations. A university press release gives 6.5% (different window or specification, unresolved). https://www.oru.se/globalassets/oru-sv/institutioner/hh/workingpapers/workingpapers2026/wp-2-2026.pdf (search extract)

- **[EVIDENCE, weak]** Revelio Labs (Simon, 2025): entry-level postings down more than 35% since Jan 2023; a 10-point rise in exposure predicts an 11% fall in entry-level demand while senior roles in the same occupations rise 7%. Vendor analysis of its own data. Cited in Hosseini and Lichtinger (fetched). https://www.reveliolabs.com/news/macro/is-ai-responsible-for-the-rise-in-entry-level-unemployment/

- **[EVIDENCE]** NY Fed "Labor Market for Recent College Graduates": unemployment for recent graduates (22 to 27) about 5.6% in Q1 2026, above the all-worker rate. By major (2024 data, updated annually each February): computer engineering about 7.5 to 7.8%, computer science 6.1% or 7.0% depending on the summary. Search summaries only; the CS figure conflicts between sources, check the NY Fed table directly. https://news.bloomberglaw.com/new-york-brief/unemployment-for-recent-college-grads-remains-high-ny-fed-says

    - Caveat: the recent-graduate unemployment premium over all workers began widening before ChatGPT. The Economic Innovation Group argued a viral chart on graduate unemployment was misleading (search summary, not read). https://agglomerations.eig.org/p/a-viral-chart-on-recent-graduate . Separate research reported by LAist attributes graduates' difficulties to remote work rather than AI (headline only, not read). https://laist.com/news/education/remote-work-not-ai-has-sidelined-recent-college-graduates-research-finds

- **[EVIDENCE]** Dallas Fed (Tyler Atkinson and Shane Yamco, 6 Jan 2026), own CPS analysis: some decline in employment for young workers in the most AI-exposed occupations, driven mainly by lower inflows (especially from outside the labour force) rather than outflows. Their scale check: if the whole decline for young exposed workers turned into unemployment, it would account for only about 0.1 percentage point of the rise in aggregate US unemployment since November 2022. https://www.dallasfed.org/research/economics/2026/0106 (search extract). This is the most useful single number for sizing the junior effect against the macro picture.

- **[EVIDENCE, secondary]** Dallas Fed (J. Scott Davis, Feb 2026): employment across the top 10% of AI-exposed industries down about 1% over the same period; argues returns to experience are rising in exposed occupations. Secondary coverage only (Fortune, 4 Mar 2026). https://fortune.com/2026/03/04/gen-z-lack-of-experience-job-wage-loss-older-worker-experience-dallas-fed (search extract)

- **[EVIDENCE, weak: correlation]** St. Louis Fed (Serdar Ozkan and Nicholas Sullivan, "Is AI Contributing to Rising Unemployment? Evidence from Occupational Variation", On the Economy, 26 Aug 2025): occupations with higher AI exposure saw larger unemployment increases 2022 to 2025; computer and mathematical occupations (exposure around 80%) among the steepest rises. Correlation reported as 0.47 for theoretical exposure and 0.57 for measured adoption (summaries disagree). The authors call it tentative and non-causal. This conflicts with Anthropic's CPS null and the Yale Budget Lab null; the difference is likely method (simple cross-occupation correlation without a pre-period comparison vs difference-in-differences). The DiD studies are stronger. https://fedinprint.org/item/l00001/101478 (search extract)

- **[EVIDENCE, weak: platform data]** Handshake (US student and graduate jobs platform): entry-level and internship postings down about 15 to 16% year on year in 2025 (Aug 2024 to Aug 2025), applications per posting up 26 to 30%; by spring 2026 postings down about 2% year on year and about 12% below pre-pandemic. Handshake's own report not seen; figures from secondary coverage, which itself attributes the squeeze to the economy and federal cuts as well as AI. https://fortune.com/2025/11/19/next-level-leadership-gen-z-college-graduates-tough-market-how-to-stand-out-according-to-jobs-experts/ (search extract)

- **[EVIDENCE, weak: VC firm, own data]** SignalFire "State of Tech Talent Report 2025" (May 2025): new-graduate share of hires at the largest tech firms about 7%, down about 25% from 2023 and more than 50% from 2019; at startups under 6%, down over 30% from pre-pandemic. Viral "big tech cut new-grad hiring by 50%" traces here: it is a fall in the new-grad share of hires versus 2019, not a 50% one-year cut in hires, and the peer group is described inconsistently (12 vs 15 firms). SignalFire itself lists smaller funding rounds, smaller teams and fewer new-grad programmes alongside AI. https://www.signalfire.com/blog/signalfire-state-of-talent-report-2025 (search extract)

- **[EVIDENCE] update to NY Fed graduates:** NY Fed college labor market page gives recent-graduate unemployment about 5.7% in Q1 2026 (underemployment 41.5%); a later report gives about 5.6% for Q2 2026 (underemployment 42%) against roughly 4.1 to 4.3% for all workers. A separate NY Fed study attributes about 64% of the rise in young-graduate unemployment from March 2019 to March 2026 to remote work, not AI (secondary coverage). https://www.newyorkfed.org/research/college-labor-market (search extract)

US Federal Reserve firm surveys

- **[EVIDENCE]** NY Fed regional business surveys (Liberty Street Economics, "Are Businesses Scaling Back Hiring Due to AI?", 4 Sep 2025): AI use in the past six months rose to 40% of New York and northern New Jersey service firms (from 25% a year earlier) and 26% of manufacturers (from 16%). Only about 1% of service firms reported AI-related layoffs and no manufacturers did; 35% of AI-using service firms were retraining workers (up from 24%). About 13% of service firms expected AI layoffs ahead, and firms expected hiring cutbacks to grow, especially for college-educated workers. Regional, firm self-report, and the workforce questions cover only AI users. https://libertystreeteconomics.newyorkfed.org/2025/09/are-businesses-scaling-back-hiring-due-to-ai/ (search extract)
- **[EVIDENCE/OPINION]** NY Fed follow-ups: Audoly, Guerin, Topa (Liberty Street, 14 May 2026) find little sign of a distinct AI-driven fall in job postings, with the slowdown attributed mainly to rates, post-pandemic over-hiring and general weakness (via Reuters coverage); Kartik Athreya ("AI's Impact on Labor and Hiring", 5 Aug 2026) summarises the evidence as a shift in skill requirements, not job elimination, with firms still expecting smaller hiring plans for graduates. https://libertystreeteconomics.newyorkfed.org/2026/08/ais-impact-on-labor-and-hiring/ (search extract)

Separating AI from interest rates and post-pandemic over-hiring

- **[EVIDENCE]** The strongest attempts to separate these come from within-firm and within-employer designs: Hosseini and Lichtinger (firm-by-time fixed effects plus a monetary-shock sensitivity test, fetched) and Lodefalk et al. (same-employer comparisons). Both still find a junior-specific decline. Brynjolfsson et al. say firm-time controls, remote-work and tech-cycle checks leave the result intact (search summary).

- **[OPINION]** The remaining weakness: all designs compare "exposed" with "unexposed" jobs, and the exposed set (software, customer service, admin, finance) overlaps heavily with the sectors that over-hired in 2021 to 2022 and are most rate-sensitive. Hosseini and Lichtinger list macro uncertainty, post-pandemic adjustment and offshoring as the competing explanations raised by others (fetched). No study yet has a clean natural experiment on adoption.
- **[EVIDENCE]** Hosseini and Lichtinger propose that the early timing (declines starting soon after ChatGPT, before most production deployments) points to forward-looking hiring cuts: firms stop hiring for roles they expect to automate. Their data cannot test this directly. Fetched.

Freelance and online labour markets (the cleanest causal evidence)

- **[EVIDENCE]** Demirci, Hannane, Zhu, "Who Is AI Replacing?", Management Science (2025). 1,386,642 job posts, Jul 2021 to Jul 2023, one global freelancing platform. About 21% fewer posts for automation-prone writing and coding jobs relative to manual-intensive jobs within about eight months of ChatGPT; writing about minus 30%, coding about minus 20%; image creation about minus 17% after image generators; applications per job up 9% (more competition). Larger falls where Google-search awareness of ChatGPT was higher. Search summary. https://spiral.imperial.ac.uk/entities/publication/88113a91-b994-4717-8526-dadac657f1cb
- **[EVIDENCE]** Hui, Reshef, Zhou, "The Short-Term Effects of Generative AI on Employment: Evidence from an Online Labor Market" (CESifo WP 10601). Upwork; after ChatGPT, writing freelancers' monthly jobs fell about 2% and monthly earnings about 5.2%; similar for image freelancers after DALL-E 2/Midjourney; top-rated freelancers were not protected and were, if anything, hit harder. Authors stress short-term. Search summary. https://www.cesifo.org/DocDL/cesifo1_wp10601.pdf

Firm-level adoption and employment growth (pre-GenAI and GenAI)

- **[EVIDENCE]** Babina, Fedyk, He, Hodson (2024), Journal of Financial Economics 151:103745: US firms investing in AI in the 2010s grew faster in sales, employment and product innovation, with more educated workforces. Pre-GenAI. As summarised in Hosseini and Lichtinger (fetched).
- **[EVIDENCE]** Acemoglu, Autor, Hazell, Restrepo (2022), Journal of Labor Economics, Burning Glass postings 2010 to 2018: AI-exposed establishments reduced non-AI hiring, but occupation and industry-level aggregate effects were too small to detect. Summarised in Hosseini and Lichtinger and listed in the Anthropic paper (both fetched).
- **[EVIDENCE]** Hampole, Papanikolaou, Schmidt, Seegmiller (2025, NBER), "Artificial Intelligence and the Labor Market": 2010 to 2023 résumé data; higher task exposure lowers demand for those tasks, but productivity gains lead firms to expand employment elsewhere, so net headcount changes are muted. Summarised in Hosseini and Lichtinger (fetched).

Exposure (FORECAST-type measures, not effects)

- **[FORECAST]** Eloundou, Manning, Mishkin, Rock, "GPTs Are GPTs" (published 2024; cited as Science in the Hosseini bibliography): task-level β score for whether an LLM could halve task time. It is the base for most exposure measures used in the effect studies above, including Anthropic's. Exposure is capability, not displacement. Fetched references only.
- **[EVIDENCE/FORECAST]** Anthropic "observed exposure": Claude covers 33% of Computer and Math tasks, well below theoretical feasibility; computer programmers highest at 75% task

coverage, customer service representatives and data entry keyers 67%; about 30% of workers have zero coverage. The most exposed quartile earns 47% more on average, is more female and more educated (17.4% hold graduate degrees vs 4.5% in the unexposed group). Each 10-point rise in coverage is associated with a 0.6-point lower BLS 2024 to 2034 growth projection, which the authors call slight. 5 Mar 2026 (fetched). https://www.anthropic.com/research/labor-market-impacts

- **[EVIDENCE]** Anthropic Economic Index, Jan 2026: adjusting exposure for task success rates makes data entry keyers and radiologists look more affected and teachers and software developers less affected than raw task coverage. Search summary. https://www.anthropic.com/research/anthropic-economic-index-january-2026-report
- **[FORECAST]** IMF Staff Discussion Note SDN/2024/001, "Gen-AI: Artificial Intelligence and the Future of Work" (Cazzaniga and others, 14 Jan 2024): almost 40% of global employment exposed to AI; about 60% in advanced economies, 40% in emerging markets, 26% in low-income countries; roughly half of exposed jobs in advanced economies judged likely to be complemented rather than substituted. Method: occupation-level task exposure (Felten-style AIOE) plus the authors' own "complementarity" coding. This is exposure, not displacement: it says nothing about how many jobs will be lost, and SDNs are staff views, not IMF positions. Headlines turning "40% exposed" into "40% of jobs will be lost" misread it. https://wiki.ubc.ca/images/b/bd/IMF_GenAI_Future_of_Work.pdf (search extract; copy of the IMF PDF, imf.org not reached)
- **[FORECAST]** Goldman Sachs (Hatzius; Briggs and Dong, 2025): generative AI will "eventually" displace 6 to 7% of US workers over the adoption period, range 3 to 14% under other assumptions; peak unemployment effect about 0.5 percentage point, with displacement effects typically fading after about two years as workers are re-employed. A 2026 update reportedly raised the share to over 9% over ten years with a peak unemployment effect under 1 point (PYMNTS only, unconfirmed). The same research notes only 9.3% of US firms reported using GenAI in production in the prior two weeks (Census BTOS). Model-based projection, not a measurement. https://www.staffingindustry.com/news/global-daily-news/ais-impact-on-jobs-likely-temporary-goldman-sachs ; 2026 update https://pymnts.com/economy/2026/goldman-sachs-says-ai-will-eliminate-15-million-us-jobs (search extracts; Goldman primary not seen)
- Felten et al. AIOE and the older Goldman "300 million jobs exposed" (2023) figure: still not verified. Do not cite from this file.

Layoff announcements citing AI (Challenger, Gray & Christmas)

- **[EVIDENCE, weak]** Challenger counts of US announced job cuts where employers cited AI: 54,836 for all of 2025; May 2026 38,579 (a monthly record for the category); June 14,029; July 10,970 of 33,429 total; through September 120,136, September only 3,961; October 1,265; January to October 2026 121,401, about 20% of all announced cuts [NOT CONFIRMED in verification pass; the October 2026 report could not be found by an independent search; DO NOT CITE until checked]. By October "Market/Economic Conditions" (130,531) overtook AI as the top cited reason. Total announced cuts Jan to Oct 2026 were 617,189, down 44% on 2025. All search summaries (challengergray.com blocked). https://www.challengergray.com/blog/october-layoffs-at-three-year-low-seasonal-hiring-plans-up-26/ ; https://www.challengergray.com/wp-content/uploads/2026/08/Challenger-Report-July-2026.pdf
- **Reliability.** (1) These are announcements, often multi-year and global, not realised US layoffs. (2) The reason is what the company says, coded by Challenger; there is an incentive to cite AI (investors reward it) and a disincentive to cite weak demand. Yale Budget Lab's Gimbel has publicly suggested some AI attributions are cover for other causes (Fortune, Feb 2026, search summary). (3) Scale: BLS JOLTS layoffs and discharges averaged about 1.1% of

employment per month over the 12 months to April 2026, about 13.4% annualised (as cited in Anthropic's June 2026 report, fetched). On roughly 159 million US payroll jobs (my approximation, not verified this session) that is around 1.7 million involuntary separations a month, so 121,000 AI-cited announcements over ten months is well under 1% of involuntary separations. AI-cited cuts are a real signal of corporate intent but a tiny share of actual job loss.

UK and Europe

- **[EVIDENCE, weak]** Morgan Stanley (reported Jan 2026): survey of firms that had used AI for at least a year, in five sectors (consumer staples and retail, real estate, transportation, healthcare equipment, autos), in the UK, US, Japan, Germany and Australia. UK respondents reported cutting 23% of jobs and creating 15% over 12 months, net minus 8%, about twice the cross-country average; US respondents net positive (one social-media summary gives US minus 17% / plus 19%, net plus 2%; Japan minus 7%, Germany and Australia minus 4%; unconfirmed). Search summaries only; primary note not seen. https://www.eweek.com/news/ai-job-losses-uk-morgan-stanley-report/ ; https://www.itpro.com/business/business-strategy/business-leaders-are-using-ai-as-a-license-to-reduce-headcount-new-morgan-stanley-research-lays-bare-the-impact-on-uk-workers
    - What it measures: the sample is AI-adopting firms in selected sectors, self-reported, not a representative sample of UK employers, and the 23% figure is not attributed to AI by any causal design. Sample size not found. See "Viral statistics traced".
- **[EVIDENCE]** Denmark: Humlum and Vestergaard, "Large Language Models, Small Labor Market Effects", NBER WP 33777 (2025; revised Oct 2025). Two adoption surveys (late 2023, 2024) of about 25,000 workers in 7,000 workplaces across 11 exposed occupations, linked to administrative employer-employee records. No significant effect on earnings or recorded hours in any occupation; confidence intervals rule out effects larger than about 1%; average reported time savings about 3% (2.8%). Search summary; existence and "no effects on earnings and hours" confirmed in Hosseini and Lichtinger (fetched). https://bfi.uchicago.edu/wp-content/uploads/2025/04/BFI_WP_2025-56-3.pdf
    - A 2026 version titled "Still Waters, Rapid Currents: Early Labor Market Transformation under Generative AI" (RFBerlin discussion paper 26078, March 2026). Gap-fill (abstract via search extract): most employers in exposed occupations have adopted chatbot initiatives, workers report productivity gains and new AI-related tasks are widespread, but difference-in-differences still gives precise null effects on earnings and recorded hours at worker and workplace level, ruling out effects larger than 2% two years after ChatGPT (the bound loosened from about 1% in the 2025 version). The authors' framing: technology reshapes work before it shows in earnings or hours. https://ideas.repec.org/p/crm/wpaper/26078.html (search extract)
- **[EVIDENCE]** Sweden: Lodefalk et al. (2026), see above: young workers in exposed occupations down about 5.5% within employers. Original working paper located (search extract).

UK official and central bank sources (gap-fill, Nov 2026)

- **[EVIDENCE, weak: postings, not causal]** Bank of England staff, Bank Underground blog (Haley Schlicht, Data and Statistics Division), "Canaries in the column? AI exposure and the UK's hiring slowdown", 6 Aug 2026: over about three years, online job adverts fell 15% in the most AI-exposed occupation group, 10% in the middle group and 6% in the least exposed; customer service adverts down 23%, administrative down 22%. The post treats AI as a plausible contributor, not an identified cause. Bank Underground posts are staff views, not

Bank policy. https://bankunderground.co.uk/2026/08/06/canaries-in-the-column-ai-exposure-and-the-uks-hiring-slowdown/ (search extract)
    - Counterpoint in the same coverage: NY Fed and Bloomberg Economics both found vacancies in AI-exposed roles were already falling before ChatGPT's release, which weakens an AI reading of the UK gradient. Bloomberg Economics (Jun 2026) further reports UK vacancies in AI-exposed roles have risen since summer 2024 and that firms themselves blame weak demand and higher employment costs (April 2025 employer National Insurance and minimum-wage rises). https://news.bloomberglaw.com/artificial-intelligence/ai-wrongly-blamed-for-britains-job-losses-analysis-suggests (search extract; methodology not seen)
- **[OPINION]** Andrew Bailey, Governor of the Bank of England (BBC Radio 4 and press, Dec 2025): AI is likely to displace workers in a way comparable to the Industrial Revolution but he does not expect mass unemployment; his main worry is entry-level roles as the pipeline into skilled professions. Context given in coverage: UK unemployment 5.1% in the three months to October 2025, with young people hit hardest. https://hrreview.co.uk/hr-news/strategy-news/ai-set-to-displace-jobs-bank-of-england-governor-warns/385541 ; https://www.insurancejournal.com/news/international/2025/12/19/851754.htm (search extracts). An October 2025 Bloomberg headline had him saying AI will not lead to UK job losses (headline only). No MPC speech with AI-specific employment data found.
- **Not found: Decision Maker Panel AI headcount question.** Searches turned up DMP general employment expectations (expected employment growth turned slightly negative, about minus 0.1%, in autumn 2025; secondary coverage) but no published DMP breakdown of AI-attributed employment effects. Do not cite a DMP AI figure until someone checks the DMP releases directly.
- **[EVIDENCE, weak: firm self-report, partly unverified]** ONS Business Insights and Conditions Survey (BICS): from March 2026 BICS asks AI-using firms what effect AI has had on headcount (increased, no change, reduced, not sure). A secondary site reports 6% of AI-using firms with 10+ employees said AI had reduced headcount (September 2026 wave); not confirmed in an ONS bulletin. The question is visible in the Scottish Government's weighted BICS workbook (wave 153, table "AIWorkforceImpact"). In 2025, firms planning adoption expected admin and clerical roles (27%), creative and design (23%) and data analysis (19%) to be most affected: expectations, not outcomes. https://www.gov.scot/publications/bics-weighted-scotland-estimates-data-to-wave-153/pages/artificial-intelligence/ ; ONS release page https://www.ons.gov.uk/releases/aiinukbusinesses (search extracts)
- **[EVIDENCE]** ONS FOI response (FOI-2026-3465): ONS does not track the relationship between AI adoption and graduate employment outcomes. So there is no official UK equivalent of the Canaries or Anthropic CPS analyses. https://www.ons.gov.uk/aboutus/transparencyandgovernance/freedomofinformationfoi/impactofaiongraduateemployment (search extract)
- **[FORECAST]** Warwick Institute for Employment Research for DSIT (Jan 2026): jobs directly involving AI activities projected to rise from 158,000 (2024) to 3.9 million by 2035. Modelled projection. https://www.gov.uk/government/publications/ai-skills-for-life-and-work-labour-market-and-skills-projections/ai-skills-for-life-and-work-labour-market-and-skills-projections (search extract)
- **[EVIDENCE, weak: firm survey]** CIPD Labour Market Outlook (Nov 2025): about one in six UK employers expect AI to let them reduce headcount in the next 12 months; a quarter of those expect to cut more than 10% of staff. Intentions, not outcomes. https://investinglive.com/news/uk-firms-expect-3-pay-rises-but-warn-ai-could-shrink-jobs-cipd-survey-shows-20251110 (search extract; CIPD primary not seen)

UK graduate and entry-level postings (gap-fill)

- **[EVIDENCE, weak: postings]** Indeed Hiring Lab UK (Aug 2026): graduate postings about 7% down year on year, lowest for the time of year since 2020; AI terms in a record 9.4% of UK postings at end June 2026. Indeed attributes the fall to cyclical weakness and AI together. Some aggregators report 13%; Indeed's own 7% is preferred. https://www.hiringlab.org/uk/?p=14268 ; https://workplacejournal.co.uk/2026/08/graduate-job-postings-at-lowest-level-since-pandemic-indeed/ (search extracts)
- **[EVIDENCE, weak: postings, vendor]** Adzuna (Jun 2025): UK entry-level adverts (graduate, apprenticeship, internship, junior no-degree) down 31.9% since November 2022; entry-level share of all listings from 28.9% to about 25%; graduate adverts in May 2025 down 28.4% year on year. A techUK page reports graduate listings below 10,000 in January 2026, down 45% year on year (secondary). The "since ChatGPT" window bundles AI with the 2023 to 2025 rate cycle and the April 2025 employer cost rises. https://hrreview.co.uk/hr-news/recruitment/entry-level-jobs-have-declined-since-chatgpt-launch ; https://www.techuk.org/insights/news/what-s-actually-happening-with-entry-level-and-graduate-jobs (search extracts)
- **[EVIDENCE]** Institute of Student Employers, Student Recruitment Survey 2025 (155 employers, about 31,000 hires, 1.8 million applications): graduate hiring down 8% in 2024/25, weakest year since 2020 (minus 12%); 42% of employers cut graduate hiring, 33% increased; 140 applications per vacancy, up 59%. The survey's AI material is about AI in selection (applicants using AI), not AI replacing graduate roles. The 2026 survey reports graduate hiring up about 4% in 2025/26, against an earlier employer forecast of minus 7%. Membership survey of large graduate employers, not representative. https://ise.org.uk/_userfiles/pages/files/reports/student_recruitment_survey_2025.pdf ; 2026 coverage https://wonkhe.com/wonk-corner/a-slightly-better-outlook-for-graduate-jobs (search extracts)
    - Read across: job-board postings (Adzuna, Indeed) show large falls; the ISE employer survey shows a smaller fall followed by a rebound. Postings are a noisy proxy for hires.

Euro area and OECD (gap-fill)

- **[EVIDENCE]** ECB blog (Laura Lebastard and David Sondermann, 4 Mar 2026), from the ECB Survey on the Access to Finance of Enterprises (SAFE) AI modules, Q2 and Q4 2025, about 5,000 firms: two thirds of firms say employees use AI tools, far fewer have invested; firms making significant use of or investing in AI are more likely to be hiring (reported as about 2% to 4% more likely, summaries differ); "AI-intensive firms tend, on average, to hire rather than fire"; effect driven by small firms and neutral for large ones. Only about 15% of AI-using firms named cutting labour costs as a motive, and those firms do show lower hiring and more layoffs. Authors: positive so far largely because AI has not yet transformed production processes. https://www.ecb.europa.eu/press/blog/date/2026/html/ecb.blog20260304~d9e34fc95f.en.html (search extract)
- **[EVIDENCE]** ECB Occasional Paper No. 395 (Ferrando, Lamboglia, Rariga, Schmidt, 2026), same SAFE modules: no sign of aggregate labour shedding; AI adoption positively associated with employment growth and expectations. ECB Economic Bulletin box (Issue 2/2026): significant AI users expect employment 1.3 percentage points higher over 12 months than non-users. Firm self-report; adopters may be faster-growing firms anyway (selection, not causation). https://www.ecb.europa.eu/pub/pdf/scpops/ecb.op395.en.pdf ; https://ecb.europa.eu/press/economic-bulletin/focus/2026/html/ecb.ebbox202602_06~c9f485c478.en.html (search extracts)
- **[OPINION/EVIDENCE]** OECD: the 2025 Employment Outlook's main theme was demographic change, not AI; no dedicated AI-effects chapter found in search extracts (Sweden's OECD

delegation summary). The 2023 Outlook found little evidence of negative AI employment effects so far. The OECD Employment Outlook 2026 has a chapter on AI and entry-level work (contents not seen). An OECD blog (Aug 2026), "Young people, labour markets and AI: what OECD evidence shows", says current OECD evidence does not show AI is responsible for the deterioration in youth labour markets and that the trend began before large language models. A figure circulating as "OECD: unemployment of 20 to 30 year olds in AI-exposed roles up 3 points in 2025" could not be found in an OECD primary source; treat as unverified. https://www.oecd.org/en/blogs/2026/08/young-people-labour-markets-and-ai-what-oecd-evidence-shows.html ; https://www.swedenabroad.se/en/embassies/oecd-unesco/current/news/oecd-employment-outlook-2025/ (search extracts)

- **Remaining gap.** Bank of England also hosted a Chandar seminar on "Canaries" in 2026 (slides URL seen in search results only). https://www.bankofengland.co.uk/-/media/boe/files/events/2026/b-chandar-slides.pdf

Worker perceptions vs measured effects

- **[EVIDENCE, weak: self-selected]** Anthropic Economic Index Survey (report 26 Jun 2026): about 9,700 Claude users linked to usage logs; not representative (30% computer and maths occupations vs 4% of US employment). 10% rated losing their own job in the next year as likely or very likely, slightly below the realised US involuntary separation rate; 38% of those attributed it to AI (an upper bound). Respondents worried more about others than themselves, especially junior colleagues: over a third put the chance of a junior colleague losing their job in the next year above 60%. Fetched. https://www.anthropic.com/research/economic-index-june-2026-report
- **[EVIDENCE, weak: self-selected]** Anthropic, 81,000 Claude.ai users, open-ended interviews coded by Claude (22 Apr 2026): about one fifth voiced displacement concern; concern rises with occupational exposure and is higher early in careers; 60% of early-career vs 80% of senior respondents said they personally benefit. Measures perceived threat only. Fetched. https://www.anthropic.com/research/81k-economics
- **[EVIDENCE]** "The AI expectations gap" (Anthropic, 16 Oct 2026): Morning Consult survey of US adults, n=10,980, 11 to 23 Aug 2026, weighted to national representativeness. Workers who expect AI to do 80%+ of their work by 2030 forecast 12.2% unemployment in 2030; those under 50% forecast 7 to 8% (baseline given: 4.2%). Median expected time for a displaced worker to find a role in a new occupation: 7 to 12 months (public) and 12 months (Anthropic staff). Fetched. https://www.anthropic.com/research/ai-expectations-gap

Viral statistics traced

- **"13% decline in jobs for young workers because of AI" (Canaries).** Origin: Brynjolfsson, Chandar, Chen, Aug 2025, ADP payroll data. What it is: a relative employment gap for 22 to 25 year olds in the most exposed occupations vs less exposed occupations, not an absolute fall and not a causal estimate by the authors' own description. The number has since been revised (16% Nov 2025; 19% by June 2026 in the Aug 2026 revision; Anthropic cites a 6 to 16% range across specifications). Solid as a descriptive fact from a large administrative dataset; weaker as proof of causation. When citing, say "relative" and give the version date.
- **"The UK lost 8% of jobs to AI" (Morgan Stanley, Jan 2026).** Origin: a Morgan Stanley survey of companies already using AI for at least a year, in five sectors and five countries, reporting their own 12-month headcount changes (23% cut, 15% created). Not a measure of the UK labour market, not a causal estimate, sample size not reported in coverage seen.

Headlines turning it into "UK lost 8% of jobs to AI" misrepresent it. ONS payroll data (not checked this session) would show nothing like an 8% fall in UK employment. Weak. (Search summaries only.)

- **"AI is behind one in five layoffs" (Challenger, 2026).** Origin: Challenger's coding of employer-stated reasons in announced cuts. About 20% of announced cuts Jan to Oct 2026 cited AI. Announced cuts are themselves a small fraction of actual layoffs (see JOLTS comparison above). Weak as a measure of displacement; reasonable as a measure of what companies want to be seen saying.
- **"40% of jobs will be affected by AI" (IMF, Jan 2024).** Origin: IMF Staff Discussion Note SDN/2024/001 (Cazzaniga and others). It is an exposure measure (task overlap by occupation), 60% in advanced economies, with about half of exposed jobs judged likely to be complemented. It is not a forecast of job losses and is a staff view. FORECAST at most. (Search extract.)
- **"Big Tech cut new-grad hiring by 50%" (SignalFire, May 2025).** Origin: SignalFire, a VC firm, using its own talent data. The 50% is the fall in the new-graduate share of hires at the largest tech firms versus 2019 (to about 7% of hires); versus 2023 the fall is about 25%. Peer group described as 12 or 15 firms in different write-ups. SignalFire lists funding and team-size causes alongside AI. Weak as evidence of AI displacement. (Search extract.)
- **"UK entry-level jobs down a third since ChatGPT" (Adzuna, Jun 2025).** Origin: Adzuna job-board adverts, Nov 2022 to mid-2025. The window coincides with UK monetary tightening and, from April 2025, higher employer National Insurance and minimum wage. Before-after comparison with no control group; postings, not hires. The ISE employer survey shows graduate hiring down 8% then up 4%. Weak as evidence about AI. (Search extract.)
- **"Goldman: AI will displace 6 to 7% of US workers."** Origin: Goldman Sachs economics research (Hatzius; Briggs and Dong, 2025). A model-based FORECAST over the full adoption period (range 3 to 14%), with a peak unemployment effect of about 0.5 point that fades in about two years. Often quoted without the time horizon or the re-employment assumption. A 2026 update reportedly raised it to over 9% over ten years (PYMNTS only). (Search extract.)
- **"Computer science graduates have among the highest unemployment rates" (NY Fed).** Origin: NY Fed outcomes-by-major table, which is updated annually and in 2026 reflected 2024 data. Summaries disagree (6.1% vs 7.0% for CS). The table is real; attributing the rate to AI is an inference nobody has tested with that table.

Strongest counter-evidence

Against "AI is already displacing workers at scale":

- Unemployment of highly exposed US workers has not risen relative to unexposed workers, with power to detect about 1 point (Anthropic, Mar 2026, fetched). Yale Budget Lab finds no unusual occupational churn (Oct 2025, search summary). Denmark's linked administrative data rules out earnings or hours effects above about 1% (Humlum and Vestergaard 2025).
- Even the Canaries authors say there is no widespread, economy-wide displacement (Aug 2026, search summary).
- AI-cited layoff announcements were falling sharply through autumn 2026 and are dwarfed by ordinary layoffs.
- Firm-level evidence from before GenAI (Babina et al. 2024; Hampole et al. 2025) finds AI-investing firms grow employment, with job losses in exposed tasks offset by expansion elsewhere.

- Euro area firm surveys (ECB SAFE, about 5,000 firms, 2025) find AI-using firms more likely to hire, not fire; NY Fed regional surveys (Sep 2025) find about 1% of service firms reporting AI layoffs and more retraining than cutting. Denmark's 2026 update still rules out earnings or hours effects above 2%. (All search extracts.)
- The Dallas Fed estimates that even if all of the young-exposed-worker employment decline became unemployment, it would explain about 0.1 point of the US unemployment rise since Nov 2022 (search extract). OECD (Aug 2026 blog) and Bloomberg Economics on the UK say youth and vacancy weakness began before LLMs.

Against the mainstream reading "nothing is happening":

- The junior-hiring effect is consistent across four independent data sources (ADP payroll, Revelio résumés, CPS, Swedish registers), uses within-firm controls in at least two, and survives a monetary-policy test. A hiring freeze at the bottom of the ladder does not show up in unemployment rates for years, because incumbents keep their jobs and new entrants are scattered across other jobs, education or inactivity. "No unemployment effect" and "a pipeline effect" are compatible.
- The freelance studies show direct, fast substitution where work is contracted task by task, which is the market form most like how agents would be deployed.
- The UK has a similar gradient in postings: Bank of England staff find adverts down 15% in the most AI-exposed occupations vs 6% in the least over three years (Aug 2026, search extract), and the Governor names the entry-level pipeline as his main worry. The St. Louis Fed finds a positive cross-occupation correlation between exposure and unemployment increases (2025). Both are correlations, and both are weaker than the DiD nulls, but they point the same way as the junior-hiring studies.

Relevance to the thesis ("the tech is easy, transformation is hard"):

- Partly supports it: aggregate effects are small three years in, consistent with slow organisational absorption. Humlum and Vestergaard's 3% time saving and Hosseini and Lichtinger's observation that adopters are a small minority of firms fit "businesses are not ready".
- Partly undercuts it: firms are already cutting junior hiring without having transformed anything, apparently on expectations. If Hosseini and Lichtinger are right, displacement can run ahead of real capability and of organisational readiness. The human consequence (lost entry routes) does not wait for the transformation to succeed.

Open questions

- Is the junior-hiring drop permanent or a temporary anticipation effect that reverses if AI under-delivers? Hosseini and Lichtinger raise this explicitly.
- Where do the "missing" young hires go: other occupations, further study, inactivity? No study traces them yet.
- Does the effect appear in the UK? The ONS/HMRC PAYE real-time data split by age and occupation could replicate the Canaries design; I found no such study, and ONS says (FOI-2026-3465) it does not track AI adoption against graduate outcomes. UK evidence is postings-based only (Bank Underground, Indeed, Adzuna).
- What does the BoE Decision Maker Panel show on AI and employment? No published AI-specific DMP result was found in search extracts.

- What are the findings of the OECD Employment Outlook 2026 chapter on AI and entry-level work? Located, not read.
- Morgan Stanley UK survey: sample size, question wording, whether the 23% cut was attributed to AI by respondents.
- Does agentic deployment (2025 to 2026) produce a second, larger wave visible in 2026 to 2027 data, or does it look like the chat-assistant wave?

What's genuinely uncertain

- Causation. All junior-employment results are difference-in-differences between exposed and unexposed groups that also differ in rate sensitivity and pandemic over-hiring. Within-firm designs reduce but do not remove this.
- Magnitudes. The Canaries gap ranges 13% to 19% across versions; Revelio 9%; CPS job-finding minus 14% (barely significant); Sweden 5.5%. These measure different things.
- Exposure measures disagree about which jobs are exposed, and the Yale/EIG work shows results can depend on the measure chosen.
- Whether entry-level cuts are AI or "AI-washing" of cost cuts. Company statements are not evidence of mechanism.
- Europe. One Swedish and one Danish study is a thin base for generalising about Europe, and they point in different directions (Sweden: junior effect; Denmark: no earnings or hours effect, though it measured a different outcome). ECB firm surveys add a positive hiring association, but that is self-reported and likely confounded by adopter selection.
- UK vs US. The UK has higher youth unemployment and steeper falls in graduate postings than the US, but also a UK-specific cost shock (April 2025 employer National Insurance and minimum wage rises) that lines up in time. Nobody has separated these with UK microdata.

Verbatim quotes

- "We find no systematic increase in unemployment for highly exposed workers since late 2022, though we find suggestive evidence that hiring of younger workers has slowed in exposed occupations" (Maxim Massenkoff and Peter McCrory, Anthropic economists, "Labor market impacts of AI: A new measure and early evidence", 5 Mar 2026) https://www.anthropic.com/research/labor-market-impacts. Context: key-findings summary of CPS analysis. Verified: curl+grep
- "The averaged estimate in the post-ChatGPT era is a 14% drop in the job finding rate compared to that in 2022 in the exposed occupations, although this is just barely statistically significant. (There is no such decrease for workers older than 25.)" (same source, 5 Mar 2026) https://www.anthropic.com/research/labor-market-impacts. Context: young-worker section. Verified: curl+grep
- "The young workers who are not hired may be remaining at their existing jobs, taking different jobs, or returning to school." (same source, 5 Mar 2026) https://www.anthropic.com/research/labor-market-impacts. Context: authors' caveat on the hiring result. Verified: curl+grep
- "Following adoption, junior employment declines sharply in adopting firms relative to non-adopters, while senior employment trends remain largely unchanged." (Seyed M. Hosseini and Guy Lichtinger, Harvard, "Generative AI as Seniority-Biased Technological Change", version 6 May 2026, abstract) https://raw.githubusercontent.com/s-mahdihosseini/Website/b99fa2962dcc4c165bbc3c41dd283afa99c5ccfb/GenAI_SenBTC_May_2026.pdf. Context: headline result. Verified: curl+pdftotext
- "The decline is driven primarily by slower hiring rather than increased separations." (same, abstract) Same URL. Verified: curl+pdftotext
- "One potential implication is that if firms overestimate the near-term automation capabilities of GenAI, the resulting decline in junior employment may ultimately prove temporary." (same, introduction) Same URL. Context: authors' forward-looking-hiring interpretation. Verified: curl+pdftotext

- "Notably, respondents were on average more worried about job loss for others than for themselves." (Anthropic Economic Index report "Cadences", 26 Jun 2026) https://www.anthropic.com/research/economic-index-june-2026-report. Context: survey of about 9,700 Claude users. Verified: curl+grep
- "The Economic Index Survey is not representative of the general population." (same) Same URL. Context: authors' own sample caveat. Verified: curl+grep
- "Across US workers, ten more percentage points of work affected is associated with 0.4 points more forecasted unemployment." (Sacher, Cotter, Jones, Korinek, McCrory, "The AI expectations gap", Anthropic, 16 Oct 2026) https://www.anthropic.com/research/ai-expectations-gap. Context: Morning Consult survey, n=10,980. Verified: curl+grep

Note: Jerome Powell's September 2025 FOMC remark on AI and young graduates appears in Hosseini and Lichtinger, but I did not fetch the Fed transcript, so it is not quoted here.

Sources worth reading in full (ranked)

1. Hosseini and Lichtinger, May 2026 version: the best-identified US study of the junior-hiring effect, with an honest discussion of rates, over-hiring and anticipation, plus a useful literature review. https://raw.githubusercontent.com/s-mahdihosseini/Website/b99fa2962dcc4c165bbc3c41dd283afa99c5ccfb/GenAI_SenBTC_May_2026.pdf
2. Brynjolfsson, Chandar, Chen, "Canaries", Aug 2026 revision and dashboard: the most-cited dataset; read the revision, not the 2025 headlines. https://digitaleconomy.stanford.edu/news/canariesaug26/
3. Massenkoff and McCrory (Anthropic), Mar 2026: clear null on unemployment, with power stated, plus a usage-based exposure measure. https://www.anthropic.com/research/labor-market-impacts
4. Yale Budget Lab, Oct 2025 report and 2026 updates: the main "no discernible disruption" source, updated regularly. https://budgetlab.yale.edu
5. Humlum and Vestergaard, NBER 33777 and the 2026 "Still Waters, Rapid Currents" version: the best administrative-data null from Europe. https://ideas.repec.org/p/crm/wpaper/26078.html
6. Demirci, Hannane, Zhu (Management Science 2025): cleanest evidence of direct substitution, in freelancing. https://spiral.imperial.ac.uk/entities/publication/88113a91-b994-4717-8526-dadac657f1cb
